Methodological note

**Employment rate:** Number of employed persons 15-64 years divided by the population 15 to 64 years old.

**Official unemployment rate:** Number of unemployed persons 15 years old and over divided by the number of persons in the labour force (employed and unemployed) 15 years old and over.

**Labour force participation rate:** number of persons 15 to 64 years old in the labour force divided by the number of population 15 to 64 years old.

Labour force participation rate and employment rate are calculated for the population 15-64 years old. While unemployment rate is calculated for the economically active population (labour force) 15 years old and over. Employment rates and labour force participation rates calculated for the population 15 years old and over are affected by the inclusion of persons in retirement in denominator and for this reason are less meaningful than rates calculated for the population 15-64 years old. Whereas in the calculation of the unemployment rate for the population 15 years old and over, in the denominator we have the economically active population, which include employed persons or persons actively looking and available for a job and as a consequence this indicator is not affected by the population above the retirement age.

**Gross average monthly wage** is calculated for employees and includes: the basic wage, additional payment for – (a) managerial duties; (b) years at work; (c) difficult working conditions; and (d) other regular additional payments. Personal social security contributions and taxation on income are not deducted from the gross average monthly wage.
