

# PRODUCER PRICE INDEX

## USERS

**Producer price index measures the change in the prices of products at the first point of sale after production.**

Producer Price Index is compatible with Eurostat methodology and covers following economic activities:

- Extracting industry, C: 10-14
- Manufacturing industry, D:15-36
- Electric power, water, and gas, E:40-41

This index doesn't include Forestry and Fisheries activity. According to Eurostat's methodology the producer price index for these two economic activities is calculated separately and is named Producer Price for Agriculture.

INSTAT calculates two indexes: Producer Price Index for domestic suppliers and Export Price Index. Calculation and publication of new Producer Price Index in Albania include:

- Producer Price Index
- Producer Price Index for Domestic Suppliers
- Export Price Index

These indices are calculated for each product classified according to the Classification of Products by economic activity (CPA) in 6 – digit level and are published in two digit level.

Renovation of the basket of enterprises and products is based on the results of Annual Structural Survey of enterprises year 2004.

For calculation of products 'weights of Producer Price Index for Domestic suppliers are used data coming from SBS 2004 while for calculation of products' weights of Export Price Index are used data coming from Foreign Trade statistics.

The weights will be renovated every year, eliminating in this way price imputations of products that are not produced more from producers.

## PRODUCER PRICE INDEX FIRST QUARTER 2011

In the first quarter 2011, Producer Price Index reached 111.8 percent (Year 2005 = 100), signing an increase by 1.0 percent compared with previous quarter. Annual change of this index is +3.1 percent.

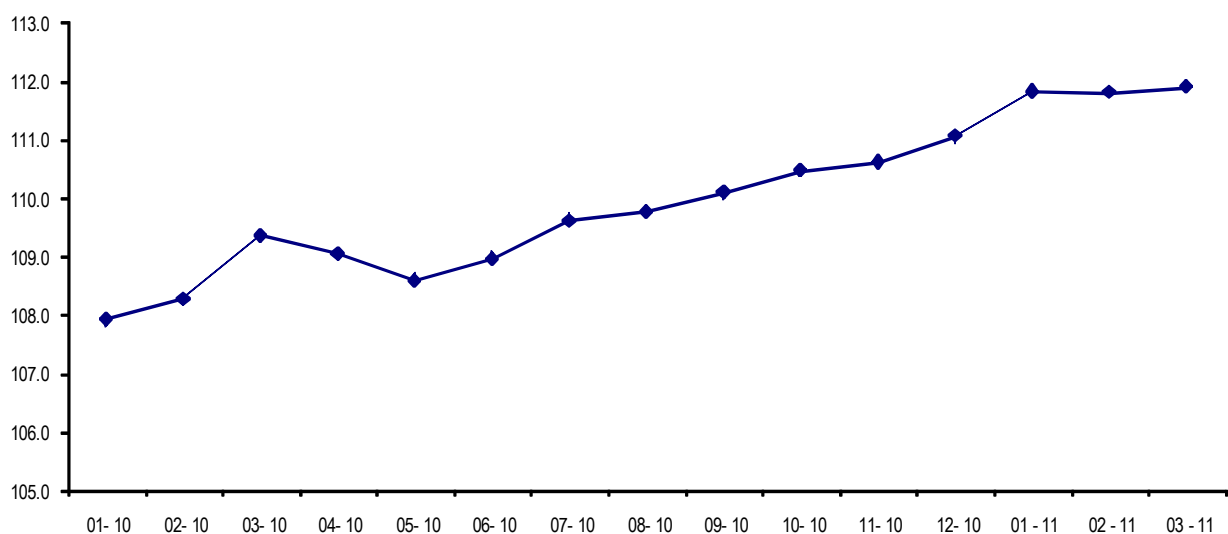

Index in "Mining and quarrying" increased by 3.2 percent. Here we can mention the increase of index prices of products in "Mining and quarrying of energy producing materials" activity and "Mining and quarrying, except of energy producing materials" activity respectively by 3.6 percent and 1.5 percent.

Producer price index in "Manufacturing" sector is increased by 1.3 percent. Within this sector we can mention the increase of index price in "Manufacture of food" activity with 2.5 percent, "Manufacture of textile" activity with 0.6 percent and "Furniture and other services" activity with 5.3 percent.

Producer Price Index for domestic production reached 110.2 percent signing an increase price by 0.7 percent compared with previous quarter. Here we can mention the increase price of "Mining and quarrying" sector by 3.5 percent.

Export index price (year 2005 = 100) reached 117.9 percent signing an increase price by 2.1 percent compared with previous quarter. Here we can mention the increase of index price in "Mining and quarrying" industry with 2.3 percent and "Manufacturing" industry with 2.5 percent.

### Producer Price Index

## Method of index calculation

Producer Price Index is base index and is calculated taking into consideration year 2005 as base year. Calculation's method used in compiling of this index is chain – index. It means that each transaction will be compared with its previous year December price (y -1). These price relatives will be weighted together to give index numbers for each 6-digit product group. These index numbers are aggregated to give index numbers for the 2-digit NACE and so on to give the export, domestic and total PPI. Hence, we will end up with monthly indices having December previous year as a base. These indices will then be chained to the previous indices for each year all the way back to the base.

For 2005 and 2006 Producer Price Index for domestic suppliers and Export price index are missing. For calculation of them we have used the same indices used for calculation of Total Producer Price Index.

## Price ratio

Is calculated automatically whenever price is entered, adjusted or imputed. The price ratio is also automatically adjusted when the base price is adjusted. One price ratio is calculated for each product each month. It is the current price divided either by the actual base price or by an adjusted base price.

## Weighting

Arithmetically weighted averages of individual observations will form the index numbers. The index (short-term-link) for a 6-digit NACE is calculated by multiplying all weights by their corresponding index numbers (price ratio) then divide by the sum of the weights.

## Imputation

The imputation is done by multiplying the previous reported price by the average monthly price movement of the closest higher level of aggregation (6-digit or 2-digit).

## Index calculation

For calculation of index is used Laspeyres type and is calculated as following:

$$L(1) \quad I_0^t = \frac{\sum_i P_{t,i} Q_{0,i}}{\sum_i P_{0,i} Q_{0,i}} = \sum_i \frac{P_{0,i} Q_{0,i}}{\sum_i P_{0,i} Q_{0,i}} \times \frac{P_{t,i}}{P_{0,i}}$$

Where:

I (t) - current index

P<sub>t,i</sub> - price of item i in period t

P<sub>0,i</sub> - price of item i in period 0

Q<sub>0,i</sub> - quantity of item in period 0

## Measures of index

The annual rate measures the price change between the current quarter and the same quarter of previous year. This measures is responsive to recent changes in price levels but can be influenced by one – off effects in either quarter.

Quarterly change measures the price changes between current quarter and previous quarter.
