Note to users:

Detailed monthly and annual data by groups are available in INSTAT's statistical database: [Consumer Price Index](#) as well as in the tables section of the website under the topic: [Consumer Price Index](#)

Methodology

Methodological changes

Starting from February 2026, the Consumer Price Index (CPI) is calculated according to the ECOICOP 2018 classification. The transition to the new classification includes the restructuring of basket items and the reclassification of certain products. The ECOICOP ver. 2 structure consists of 13 main divisions, further detailed into groups, classes, and subclasses. The implementation of this classification is in line with Regulation (EU) 2024/3159, ensuring full harmonisation with European and international statistical practices.

The index reference period has been changed from December 2020 = 100 to 2025 = 100.

In addition, in January, as every year, the Consumer Price Index incorporates several methodological updates in accordance with international compilation standards. These include:

- Update of weights: Weights are changed; they are now based on the average expenditure from 2023 Household Budget Survey.
- Update of basket: The list of goods and service content 411 products.
- Updating the list of outlets where prices are collected.

Definitions

The Consumer Price Index (CPI) is the official measure of inflation in Albania. The index measures the relative changes in prices of goods and services used by households for their own consumption and is calculated using the structure of final household consumption expenditure. The main source of expenditure information is the Household Budget Survey.

The annual change measures the change in the price index between the current month and the same month of the previous year. This change reflects current movements in price levels but may also be influenced by one-off effects in any given month.

The monthly change measures the change in the price index of the current month compared with the previous month. This indicator is sensitive to seasonal effects.

The 12-month average change measures the change in the average consumer price index over the last 12 months compared with the average index of the preceding 12 months.
